

# L - List file on terminal.

## Syntax:

```
L  
L filename  
Ls filename  
Ls-f filename  
Ls,c filename
```

## Examples:

```
L  
L /cat/myfile  
L3-5 /cat/dog  
L7,30 /cat/ninetails
```

## Options:

filename  
is the name of a text file.

s  
is a positive integer. FRED will start listing the file at the given line number instead of the start of the file.

f  
is a positive integer. If you say Ls-f, FRED starts listing the file at line s and ends with line f. For example, L3-5 lists lines 3 to 5 of a file.

c  
is a positive integer. If you say Ls,c, FRED starts listing the file at line s and lists a total of c lines. For example, L7,20 lists 20 lines beginning at line 7.

## Description:

L displays the contents of an ASCII or BCD file on the terminal. It does not change ". ". If you do not specify a file name, FRED uses the file name associated with the current buffer.

L does **not** change the file name associated with the current buffer.
