

Z - Zap the address.

Syntax:

z

Description:

z sets the current line pointer ". ". If you specify an address, z sets the current line pointer to that line. Otherwise, z leaves ". " where it is (which means z does nothing). This is the equivalent of a "no-op" in a programming language.

Many other commands have names made up of z followed by another letter. These are known as *zap* commands. Because of the possibility of confusion, there must be a space, tab, or new-line character immediately following the z of the z command.

The other Zap commands are listed below.

ZA	Append buffer
ZB	Sort in reverse order
ZC	Clear questionable flag
ZD	Delete buffer
ZG	Gather output
ZI	Change spaces to tabs
ZK	Kopy lines from one buffer to another
ZL	Convert to lower case
ZM	Move lines from one buffer to another
ZO	Change tabs to spaces
ZP	Print buffer
ZR	Go to buffer containing file
ZS	Sort in ascending order
ZT	Translate characters
ZU	Convert to upper case
ZV	Undo most recent V command
ZW	Append buffer to file
